"我的 Windows Phone 果然有问题"

Modern AArch64 SoC UEFI + ACPI port from A to Z

Bingxing Wang (@imbushuo), 5/16/2020 imbushuo.net

Post your questions to *hi(at)imbushuo.net*

Also the team: Gustave Monce (@gus33000), ADeltaX, José Manuel Nieto (@SuperJMN), Googulator, CornyjK, Dj Art, Simone Franco, Tiger Wang and woachk

Table of Contents

- Modern mobile SoC boot flow
- AArch64 UEFI Introduction
- AArch64 ACPI Introduction
- Case: Lumia 950 (XL) & Porting TianoCore
- Bonus: Nintendo Switch
- Bonus #2: hypervisor privilege escalation on MSM8994
- Feel free to ask questions at any time

Non-goal

• OS-specific driver bring-up and implementation

About me

- Final-year college student
- Site Reliability Engineer Intern @ LinkedIn
 - Technically it is Microsoft
- Firmware and hardware hacks for fun
 - I can't play games well
- •"外国黑客" @ ITHome

铺路Win10手机端:黑客在Lumia 950 XL上成功安装UEFI

2018/4/7 15:14:51 来源: IT之家 作者: 浮生 责编: 浮生 <u>评论: 0</u>

微软lumia640-TechWeb领先的互联网消费互动媒体

IT之家4月7日消息 截至目前,已有许多开发人员和黑客尝试在Windows 10手机上运行Windows 10 on ARM。但是通向这个目的地最主要障碍是无法部署Windows 10所需的安全启动 (Secure Boot) 和UEFI引导,它们是硬件与Windows 10系统之间的中介。

2018年1月24日 - 今天Twitter用户@imbushuo晒出了一组Windows RT 8.1系统成 XL上...3月初时,微软在西班牙巴塞罗那正式发布中端Windows Phone新机:Lumia TechWeb - 百度快照

一位Twitter名为Ben | imbushuo的黑客最近发表推文,表示自己通过编写了所需最低限度的驱动,在 Lumia 950 XL上成功地运行了UEFI引导。

Modern mobile SoC boot flow

- Modern mobile SoC is complicated
 - Rich features and connectivity
 - Performance improvements every year
 - When in doubt, add one more general-purpose CPU
 - There are more than 12 CPUs in Snapdragon 810
 - AP(Cortex A53 & A57), Modem and GNSS(QDSP6), Audio (Xtensa), Video(Cortex-A), GPS(Cortex-A), Power (Cortex-M)
- Boot the SoC
 - Subsystems have dependencies
 - Can't boot them all at once
 - Static Root of Trust & trust chain for boot security

UEFI + ACPI on AArch64

Common ARM bootstrap situation

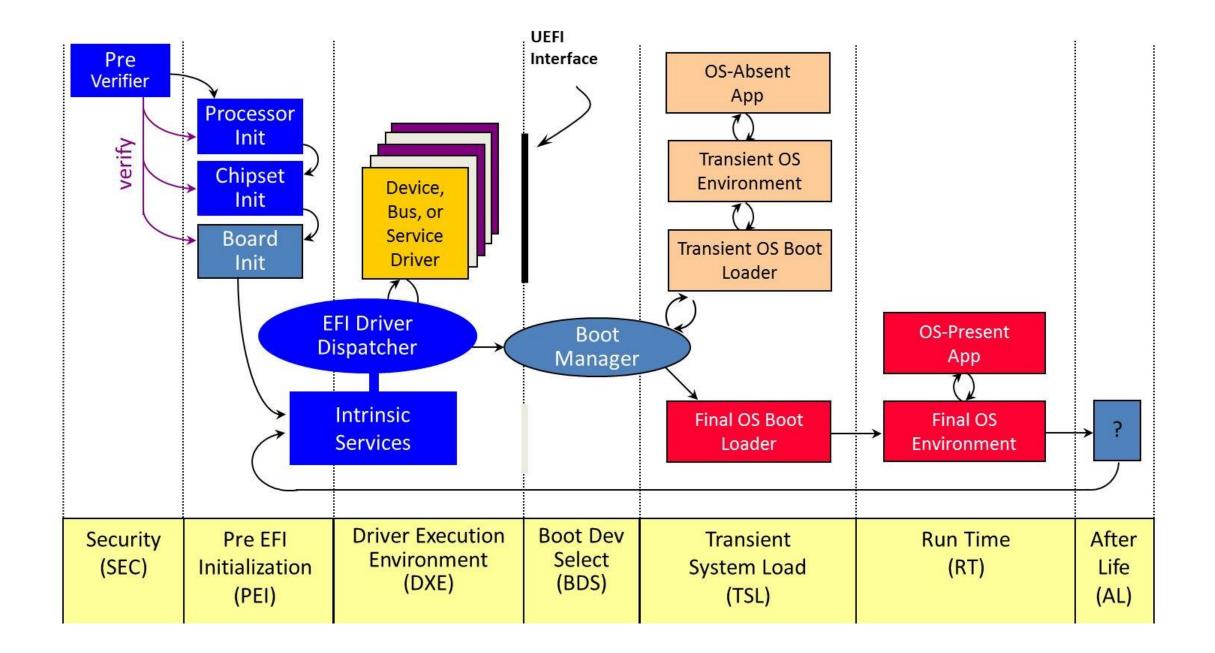

- Platform-specific images
 - No generic image for all devices
- Board init file or device tree for topology
 - Because "embedded"
 - No flexibility in hardware configuration
- U-Boot is a popular choice
 - For very long time and it continues
 - Also implemented UEFI recently: <u>https://www.suse.com/media/article/UEFI_on_Top_of_U-Boot.pdf</u>
 - Enough to boot GRUB, not targets Windows yet

UEFI and **ACPI**

- Existing (yet broken) industry standard on PC for years
- A defined set of interfaces and protocols for OS interaction
 - Like BIOS interrupt on PC/AT
- Commercially introduced to ARM platform with Windows RT (ACPI 5.0)
 - Linux implemented UEFI support for both AArch32 and AArch64
 - Either Device Tree or ACPI for hardware description
 - But Linux ARM ACPI is AArch64 exclusive
- Enhanced with AArch64 development recently
- Try UEFI on Raspberry Pi 3 and 4
 - https://rpi4-uefi.dev/
 - <u>https://connect.linaro.org/resources/ltd20/ltd20-207/</u>

UEFI vs. U-Boot

- U-Boot optimizes for size
 - U-Boot links built-in things together for speed and size
 - U-Boot features and environments can be customized
 - Single file for each phase, can be stripped
 - Versatile payloads
- UEFI targets generalization
 - LZMA-compressed, firmware volume
 - UEFI drivers are PE/COFF executables
 - UEFI Drivers usually run fine on another implementation
 - Most UEFI implementations have a baseline for protocols a lot
 - EFI applications

ACPI on ARM

- Hardware-reduced ACPI: just a bunch of ACPI tables
- Fixed ACPI tables and DSDT
 - MADT Generic Interrupt Controller
 - GTDT Architectural Timer
 - CSRT Vendor IP cores such as DMA controller
 - IORT IOMMU redirection table
 - PPTT Processor topology
 - MCFG PCIe MMIO
 - FACS Firmware control
 - FADT Fixed ACPI description

```
• ...
```

ACPI static tables

[078h	0120	1]	Efficiency Class :	00	
[079h	0121	3]	Reserved :	000000	

DSDT table

- DSDT contains both topology information and optional program logics
- Bytecode-based DSL
 - OS runs it
 - Turing complete
 - Memory I/O with bytecode instructions
 - Capable to handle multiple OS scenarios
- Dynamic updates with SSDT tables
 - Device Tree is usually a static table (with optional overlays)

```
Device (SDC1)
   Name ( DEP, Package (One) // DEP: Dependencies
       \_SB.PEP0
   })
   Name (_HID, "QCOM24BF") // _HID: Hardware ID
   Name (_CID, "ACPIQCOM24BF") // _CID: Compatible ID
   Name (_UID, Zero) // _UID: Unique ID
   Name (_CCA, Zero) // _CCA: Cache Coherency Attribute
   Method (_CRS, 0, NotSerialized) // _CRS: Current Resour
       Name (RBUF, ResourceTemplate ()
           Memory32Fixed (ReadWrite,
               0xF9824900,
                                   // Address Base
               0x00000200,
                                   // Address Length
           Interrupt (ResourceConsumer, Level, ActiveHigh,
               0x0000009B,
       })
       Return (RBUF) /* \_SB_.SDC1._CRS.RBUF */
   Device (EMMC)
   { ....
    }
   Method (_DIS, 0, NotSerialized) // _DIS: Disable Device
    {
    }
   Method (_STA, 0, NotSerialized) // _STA: Status
   { ...
    }
```

A sample DSDT device object

- Dependency entries
- ID entries
- Cache coherency attribute for DMA
- Resource settings MMIO, interrupt, GPIO, ...
- ACPI methods status, ...
- Sub-devices

Lumia 950 (XL)

- Snapdragon 808 / 810 SoC
 - Cortex A53 + A57, AArch64
- Windows Phone OS never goes AArch64
 - EL1 runs in AArch32 mode
 - But EL2 hypervisor and EL3 are AArch64

AArch64 Exception Levels

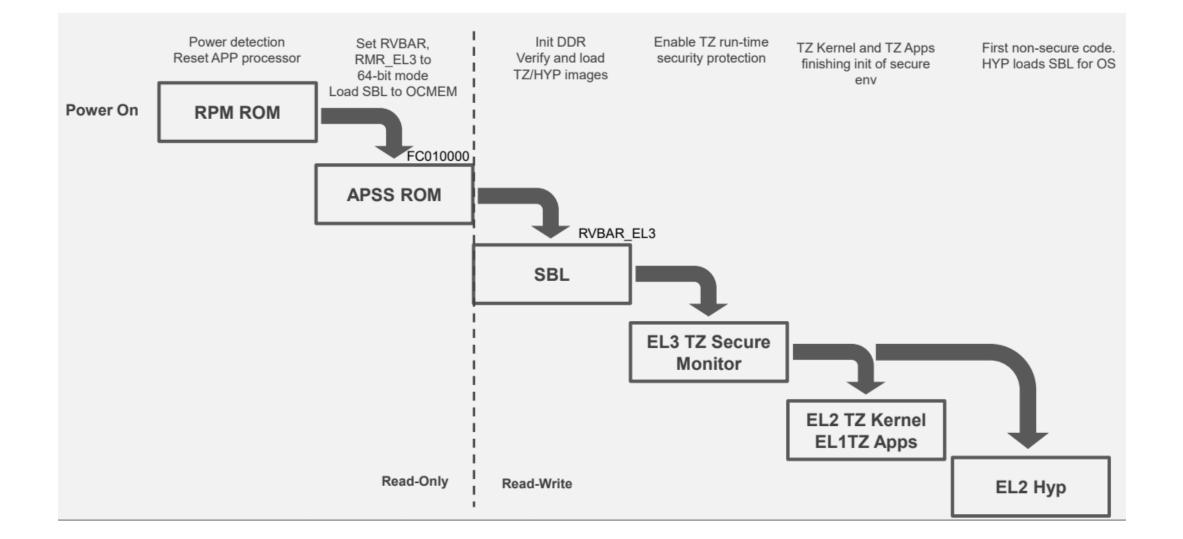

* Recently Secure EL2 (Secure partition manager) is introduced

Snapdragon 810 Boot Flow

- Boot from eMMC or UFS
 - GPT-based partitioning
 - Partition layout is mostly identical
- Vendor blobs partition and system partition
 - SBL, Modem, DSP, Hypervisor, TrustZone Monitor, UEFI
 - EFI system partition, Windows OS partition
- RPM boots from hardwired PBL, PBL loads SBL
- Final stage bootloader loads OS
 - OS boots subsystems (Audio, Modem, GNSS, GPU, DSP)
 - TrustZone RPC calls

Snapdragon 810 Boot Flow (cont.)

Getting code execution

- "OEM unlock" on Android devices
 - Allows arbitrary code execution in EL1
 - Does not allow modifying bootloader
 - Windows Phones are locked down in production

On

Desktop backup password Desktop full backups aren't currently protected

Stay awake Screen will never sleep while charging

Enable Bluetooth HCI snoop log Disabled

OEM unlocking Allow the bootloader to be unlocked

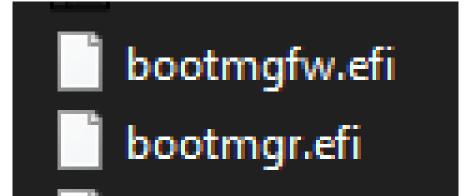

Running services View and control currently running services

Picture color mode Use sRGB

Getting code execution (cont.)

- Nokia (MMO) exploit allows arbitrary flash I/O
- Qualcomm UEFI variable services exploit
 - UEFI spec uses variable to report Secure Boot status
 - Secure Boot status variable is expected to be volatile
 - Let's put SecureBoot = θ in the variable storage...
 - Firmware reports Secure Boot off to Windows Boot Manager (!)
 - Can't run EFI application payloads due to additional checking
- <u>https://github.com/ReneLergner/WPinternals</u>
- Seize control from Windows Boot Manager

Arguments

BOOT_APPLICATION

An application that runs in the Windows boot environment. For more information about boot applications, see <u>About BCD</u>.

CONSOLE

Documentation Learn Code Samples

Win32 character-mode application. The operating system provides a console for console applications. If main or wmain is defined for native code, int main(array<String ^> ^) is defined for managed code, or you build the application completely by using /clr:safe, CONSOLE is the default.

ArmDataSynchronizationBarrier();
ArmInstructionSynchronizationBarrier();
```

ArmMoveToProcessor(FirmwareDescriptor->ExceptionState.Vbar, CP15_VB/
ArmInstructionSynchronizationBarrier();

// Restore IRQ if necessary
if (InterruptState) ArmEnableInterrupt();

Getting code execution (cont.)

- Windows Boot Manager initializes its own environment
 - MMU, exception vector, ...
 - A struct used to describe the firmware context and app context
 - Switch context to access UEFI services
- Secret Secure Monitor call to enter AArch64 EL1
 - Secret SMC call for switching from AArch32 to AArch64
 - Specifies entry point address and switch
- https://github.com/imbushuo/boot-shim

Port TianoCore to new platform

• Toolchains

- Linaro GCC or any recent AArch64 GCC
- Clang/LLVM should work
- Platform docs and firmware layout
 - Set required package properties in .DSC and .FDF file
- SEC/PEI
 - ARM Trusted Firmware
 - SoC-specific loaders
- DXE
 - Port drivers

TianoCore/EDK2 directory structure

- Feature/Silicon support modules are categorized as "packages" – ArmPkg, MdePkg, MdeModulePkg, …
- Top level packages contain applications, libraries and blob resources
- Package manifest (.DSC and .DEC) provides metadata information
 - GUID/Protocol tokens
 - C Header directories
 - Config key-value pairs
 - Customized tools
 - ...
- Firmware manifest (.FDF) describes FD layout
 - The firmware package
 - Executable

Lumia950XLPkg status

- Tracking the TianoCore master branch
- SoC devices
 - Some drivers are ported from LK and the EFIDroid project
 - Power Management (PMIC, RPM, Pinctrl)
 - Low speed I/O (GPIO, I2C, SPI)
 - High speed I/O (SDHCI, PCIe)
 - FrameBuffer display
- Peripherals
 - Synaptics RMI4 I2C digitizer
 - Lattice iCE5LP2K bitstream uploader
- ACPI ready

Bonus: Nintendo Switch

Bonus: EL2 privilege escalation on MSM8994 Mick

Injecting shellcode,** You have been served Mining at EL2 UEFI Henory Base = 0x20000000, Size = 0x7800000, Stack Base = 0x277C0000, Stack Size = 0x40000 HUU configured from device config

Injecting shellcode

// but if secondary CPUs are launched, exception vector will be // fixed so CPU0 call would fail. Therefore we patched // PSCI_CPU_SUSPEND_AARCH64 handler at 0x06c03aa8. DEBUG((EFI_D_ERROR, "Injecting shellcode...\n")); EFI_PHYSICAL_ADDRESS PsciCpuSuspendHandlerAddr = 0x06c03aa8; UINT8 *PsciCpuSuspendHandler = (UINT8 *)(V0ID *)PsciCpuSuspendHandlerAddr; CopyMem(PsciCpuSuspendHandler, El2ShellCode, sizeof(El2ShellCode)); ArmDataSynchronizationBarrier(); ArmInvalidateDataCache();

EL2 privilege escalation

- On MSM8992 and MSM8994, EL2 hypervisor resides in the trust boundary of EL1 supervisor (aka. kernel)
- Finding the exception vector...address writable
- Let's patch the vector table on the fly
